

Plant Cycle

Now that your plant is in the soil, it's going to start to grow. It's helpful to know how your plant grows so you can best take care of it.

Other plants make seeds that are not contained within a fruit, which we don't usually eat like carrot seeds, kale seeds, and spinach seeds. The plant will drop these seeds in the soil or we can collect the seeds and plant them later on. Once the seeds are planted in the soil, the plant cycle starts over again.

Watch an example of a seed moving through the seed **cycle** at bit.ly/3tRQ9jB or by scanning the QR code.
